

ASSIGNMENT: Blockchain Tech [Afternoon]

Name: Uy RathbanditPitou

Reflection: “Why Digital identify on blockchain”:

Digital identity on blockchain is important because it makes our personal information more secure and harder to fake. In today’s world, many documents we rely on, such as passports, school certificates, or medical records, are still stored in central systems. The problem with this is that central systems can be hacked or changed, which means information can be stolen or even faked. Blockchain gives a new way to solve this issue because it keeps data in a decentralized system that is very hard to tamper with. Once information is recorded there, it stays authentic and cannot easily be forged.

I can imagine many useful situations for this. For example, if passports were stored on blockchain, it would be much harder for someone to create a fake one. Border officers could quickly check the details and know it is real. With Blockchain, Information in a passport can be very secure by cryptography keeps the data safe. In education, certificates kept on blockchain would give employers confidence that the document is genuine and not altered or deleted. The same is true in healthcare, where digital identities could help doctors share patient records in a secure way. Patients would still control who can see their data, but doctors would be sure the records are accurate. In addition, financial institutions that use online payments with blockchain could help to keep the transaction secure. especially, the transfer of assets (such as cryptocurrency, tokens, or data) between participants.

Overall, digital identity on blockchain makes me realize how much safer and easier life could be. It gives stronger security, ensures authenticity, and helps reduce forgery. I believe it will play a big role in the future of Finance, travel, education, and healthcare.
